Webinar: Elasticsearch Security Beyond Defaults – What Production Environments Really Require

Anja Glauch · 2026-05-06

Elasticsearch's built-in security has come a long way - but for production environments, the basics aren't enough. Compliance requirements, multi-tenant access, enterprise identity integration, and fine-grained data control all demand capabilities that go well beyond default settings.

In this session, we'll walk through what production-grade Elasticsearch security actually looks like, where common gaps appear, and how Search Guard fills them - without adding operational complexity.

This link is no longer valid. Please cont

What you'll take away:

- A clear picture of what default Elasticsearch security does and doesn't cover
- Key requirements for production environments: audit logging, field- and document-level security, LDAP/SAML/OIDC integration, and encryption at rest
- A practical framework for assessing your current security posture

Whether you're running a greenfield deployment or hardening an existing cluster, this session gives you the clarity to make confident security decisions.
